Claim Amendments

This listing of the claims will replace all prior versions, and listings, of claims in the application:

Claim 1 (withdrawn-currently amended): A method for producing a vertical transistor having a gate electrode, a gate oxide, an upper source/drain region, and a lower source/drain region, the method which comprises:

producing at least one first trench in a substrate with a substantially vertical substrate edge;

producing a sacrificial gate oxide on at least a first trench wall;

producing a sacrificial gate electrode on the sacrificial gate oxide;

producing an insulation structure for insulation between different vertical transistors;

removing the sacrificial gate electrode from the trench;

removing the sacrificial gate oxide from the trench;

at least at a location of the sacrificial gate oxide,
producing the gate oxide on the trench wall;

producing the gate electrode on the gate oxide, the gate oxide
insulating the gate electrode from the substrate, the
insulating structure bounding the gate electrode in a region
in which the gate oxide covers the substantially vertical
substrate edge, and the gate electrode forming an angle α of
90° or less with the insulating structure; and

producing the upper source/drain region and the lower
source/drain region.

Claim 2 (withdrawn): The method according to claim 1, wherein
the step of removing the sacrificial gate oxide is carried out
by an isotropic etching.

Claim 3 (withdrawn): The method according to claim 1, wherein
the step of removing the sacrificial gate oxide is carried out
by a wet-chemical etching.

Claim 4 (withdrawn): The method according to claim 1, which
comprises using trench insulation as the insulation structure.

Claim 5 (withdrawn): The method according to claim 4, which comprises:

producing at least one second trench for generating the trench insulation; and

filling the second trench with an insulating material such that a first trench insulation wall forms an edge with the first trench wall.

Claim 6 (withdrawn): The method according to claim 5, which comprises, during the step of removing the sacrificial gate oxide, removing the insulating material from the trench insulation in a region of the first trench insulation wall such that at least one substrate edge is exposed.

Claim 7 (withdrawn): The method according to claim 6, wherein the gate oxide is also applied to the substrate edge.

Claim 8 (withdrawn): The method according to claim 6, which comprises forming a gate electrode having an internal angle α of 90° or less with the first trench insulation wall.

Claim 9 (withdrawn): The method according to claim 1, which comprises, before performing the step of producing the

sacrificial gate oxide, producing an insulation layer on a base of the first trench.

Claim 10 (withdrawn): The method according to claim 9, wherein the insulation layer is a silicon nitride layer.

Claim 11 (withdrawn): The method according to claim 1, which comprises performing at least one step selected from a group consisting of the step of producing the sacrificial gate oxide and the step of producing the gate oxide by a thermal oxidation.

Claim 12 (withdrawn): The method according to claim 1, wherein the insulating structure includes an insulating material produced from silicon dioxide.

Claim 13 (withdrawn): The method according to claim 1, which comprises using polysilicon as a material of at least one electrode selected from a group consisting of the sacrificial gate electrode and the gate electrode.

Claim 14 (withdrawn): The method according to claim 1, wherein the vertical transistor is produced over an energy storage capacitor and forms a part of a memory cell.

Claim 15 (withdrawn): The method according to claim 1,
wherein the vertical transistor forms a part of a DRAM memory
cell.

Claim 16 (currently amended): A vertical transistor,
comprising:

at least one trench wall;

a plurality of source/drain regions;

a channel region running essentially vertically on said trench
wall;

a gate electrode;

a gate oxide insulating said gate electrode from said channel
region; ~~and~~

at least one insulation structure for insulating between
different vertical transistors; and

a substantially vertical substrate edge;

said insulation structure bounding said gate electrode in a region in which said gate oxide covers said substantially vertical substrate edge; and

said gate electrode having an internal angle α of 90° or less with said insulation structure.

Claim 17 (original): The vertical transistor according to claim 16, wherein said insulation structure is trench insulation.

Claim 18 (cancelled).

Claim 19 (currently amended): The vertical transistor according to claim 16, ~~comprising~~

~~an essentially vertical substrate edge,~~

wherein said insulation structure ~~being~~ is trench insulation;
and

said gate electrode at least partially ~~covering~~ covers said gate oxide in a region of said ~~essentially~~ substantially vertical substrate edge.

Claim 20 (original): The vertical transistor according to claim 16, wherein said gate electrode forms an internal angle α of 60° or less with said insulation structure.

Claim 21 (original): The vertical transistor according to claim 16, in combination with a memory cell, wherein said memory cell includes an energy storage capacitor and said vertical transistor is formed above said storage capacitor.
